WATER SUPPLY OUTLOOK FOR NEVADA

FEDERAL - STATE - PRIVATE COOPERATIVE SNOW SURVEYS

UNITED STATES DEPARTMENT of AGRICULTURE...SOIL CONSERVATION SERVICE,
and

NEVADA DEPARTMENT of CONSERVATION and NATURAL RESOURCES
DIVISION of WATER RESOURCES

Data included in this report were obtained by the agencies named above in cooperation with Federal, State and private organizations listed on the last page of this report.

TO RECIPIENTS OF WATER SUPPLY OUTLOOK REPORTS:

Most of the usable water in western states originates as mountain snowfall. This snowfall accumulates during the winter and spring, several months before the snow melts and appears as streamflow. Since the runoff from precipitation as snow is delayed, estimates of snowmelt runoff can be made well in advance of its occurrence. Streamflow forecasts published in this report are based principally on measurement of the water equivalent of the mountain snowpack.

Forecasts become more accurate as more of the data affecting runoff are measured. All forecasts assume that climatic factors during the remainder of the snow accumulation and melt season as they affect runoff will add to be an effective average. Early season forecasts are therefore subject to a greater change than those made on later dates.

The snow course measurement is obtained by sampling snow depth and water equivalent at surveyed and marked locations in mountain areas. A total of about ten samples are taken at each location. The average of these are reported as snow depth and water equivalent. These measurements are repeated in the same location near the same dates each year.

Snow surveys are made monthly or semi-monthly from January 1 through June 1 in most states. There are about 1400 snow courses in Western United States and in the Columbia Basin in British Columbia. In the near future, it is anticipated that automatic snow water equivalent sensing devices along with radio telemetry will provide a continuous record of snow water equivalent at key locations.

Detailed data on snow course and soil moisture measurements are presented in state and local reports. Other data or reservoir storage, summaries of precipitation, current streamflow, and soil moisture conditions at valley elevations are also included. The report for Western United States presents a broad picture of water supply outlook conditions, including selected streamflow forecasts, summary of snow accumulation to date, and storage in larger reservoirs.

Snow survey and soil moisture data for the period of record are published by the Soil Conservation Service by states about every five years. Data for the current year is summarized in a West-wide basic data summary and published about October 1 of each year.

PUBLISHED BY SOIL CONSERVATION SERVICE

D. A. WILLIAMS, Administrator

The Soil Conservation Service publishes reports following the principal snow survey dates from January 1 through June 1 in cooperation with state water administrators, agricultural experiment stations and others. Copies of the reports for Western United States and all state reports may be obtained from Soil Conservation Service, Western Regional Technical Service Center, Room 507, 701 N. W. Glisan, Portland, Oregon 97209.

Copies of state and local reports may also be obtained from state offices of the Soil Conservation Service in the following states:

^{*}LOCATED ON ADJACENT WATERSHED

WATER SUPPLY OUTLOOK

FOR NEVADA

March 1, 1968

* Nevada's 1968 water supply outlook dropped to "poor" in * ÷ the northeastern part of the state but remains "near average" along the Sierras. Snow cover varies from one-* third of average, in northeastern Nevada, to about average in southern Nevada. Reservoir storage is well ÷ above average along the Sierras and below average on the Humboldt and Owyhee. Watershed soils are well primed * × and should aid apring runoff. Streamflow forecasts for the April-July period range from 36 percent of average * on the Owyhee to 90 percent on the Truckee.

SNOW COVER

Snow cover generally declined over the state during February, due to warmer-than-average temperatures and rain at elevations up to about 8,000 feet. All low-elevation snow was washed away. Basin snow cover percentages now range from 30 to 40 percent of average, on the Owyhee-Humboldt, to 70 to 80 percent on the Tahoe-Truckee and 90 percent in southern Nevada. The Walker Basin has 63 percent and the Carson 78 percent of the March 1 average.

SOIL MOISTURE

Watershed soils were generally well primed over most of the state by rain and melting snow last month.

RESERVOIR STORAGE

Nevada's seven principal reservoirs, exclusive of Mead and Mohave, now hold 1,025,000 acre-feet of water, or 141 percent of the March 1 average for the 1948-62 period. Storage on the Humboldt and Owyhee is below average, while storage along the Sierras is well above average for this early in the season.

STREAMFLOW FORECASTS

Streamflow forecasts for the April-July period range from 36 percent of average on the Owyhee to 90 percent on the Truckee.

The Humboldt at Palisade is expected to flow 75,000 acre-feet, or 43 percent of average. The Carson is forecast to flow 100,000 acre-feet, or 65 percent, at Fort Churchill and 140,000 or 78 percent at Gardnerville. The West Fork Carson is expected to flow 40,000 acre-feet, or 77 percent of average.

The West Walker is expected to flow 110,000 acre-feet, or 78 percent of average, and the East Walker is forecast to flow 40,000 acre-feet, or 70 percent of average.

Lake Tahoe is forecast to rise 1.1 feet from April to the high elevation. This forecast indicates that water in excess of the requirement to maintain Floristan rates will be released to prevent the lake level from exceeding the maximum elevation of 6229.1, according to the Truckee Basin Forecast Committee.

ELECTRONIC SENSORS

Radio-reporting snow sensors indicated that a peak snow water content was reached about February 20 and that melt began after that date. About 2.5 inches of water was lost from the snow pack by March 1 at the 7,000-foot elevation.

NEVADA STREAMFLOW FORECASTS - MARCH 1968

The following summarized runoff forecasts are based principally on mountain snow cover and the assumption that precipitation and temperature will be near average from the present time to the end of the forecast period. Appreciable deviations from normal of temperature and/or precipitation will correspondingly modify these forecasts.

SNOW WATER ACCUMULATION IN NEVADA

Percent of average maximum accumulation

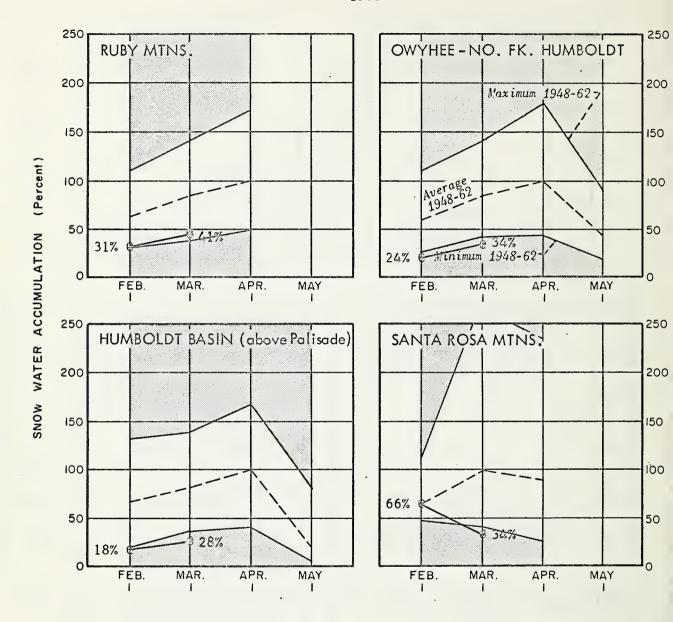

1968

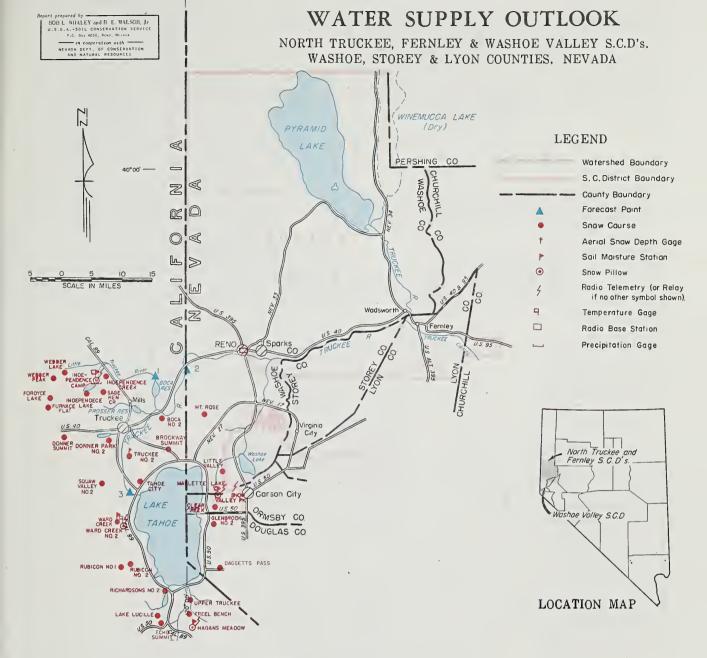

SNOW WATER ACCUMULATION IN NEVADA

Percent of average maximum accumulation

1968

March 1, 1968

March 1 snow surveys indicate that the snow pack in the Lake Tahoe Basin is about 75 percent of average. Warm temperatures and rain have caused the melt to start in the snow pack at high elevations, as indicated by remote radio sensors in the basin.

Lake Tahoe is forecast to rise 1.1 feet from April 1 to maximum elevation. This indicates that water in excess of the requirement to maintain Floriston rates will be released from Lake Tahoe to prevent the lake level from exceeding the maximum elevation of 6229.1. The Truckee at Farad is forecast to flow 242,000 acre-feet during April-July, and the Little Truckee above Boca 82,000 acre-feet, according to the Truckee Basin Water Committee.

Lake Tahoe hold 610,000 acre-feet which is 83,000 percent of capacity, or 154 percent of average.

Carson Valley water users are expected to have only fair 1968 irrigation water supplies.

Snow cover on the Carson River Basin is 78 percent of the 1948-62, 15-year, average and only 61 percent of last year at this time. Warm temperatures and rain during February melted snow to about the 8,000-foot level, exposing south slopes to at least that elevation. February streamflow was 143 percent of average at Carson City, and Lahontan Reservoir held 246,000 acre-feet as of March 1, or 132 percent of average.

Precipitation Gage

Streamflow forecasts for the April-July period range from 65 percent of average, or 100,000 acre-feet, at Fort Churchill to 78 percent of average, or 140,000 acre-feet, on the East Fork at Gardnerville. The East Carson is expected to fall to 200 c.f.s. about July 12, 1968. The West Fork is expected to flow 40,000 acre-feet, or 77 percent of average, and the Carson at Carson City is forecast to flow 120,000 acre-feet, or 71 percent of average.

WATER SUPPLY OUTLOOK

STILLWATER, SHECKLER, LAHONTAN S.C.D's. & VICINITY CHURCHILL COUNTY, NEVADA

March 1, 1968

The 1968 water supply outlook for the Fallon area is boosted to "average" again this year, due to above-average reservoir storage.

Snow cover is 78 percent of the March 1 average and only 69 percent of last year at this time. Lower-elevation snow was washed away by warm temperatures and rain during February. Reservoir storage is above average.

Lake Tahoe held 610,000 acre-feet, or 155 percent of average, and Lahontan held 246,000 acre-feet, or 132 percent of its March 1 average.

The Carson at Fort Churchill is forecast to flow 100,000 acre-feet, or 65 percent of the April-July average. The Truckee Basin Forecast Committee forecasts the Truckee to flow 242,000 acre-feet, or 90 percent of average, and Lake Tahoe is expected to rise 1.1 feet in elevation after April 1, assuming the gates remain closed.

Water users on the Walker River who use water stored in the Topaz and Bridgeport reservoirs can expect a good supply this year. Users who depend on natural streamflow will have only a fair supply, with little late-season flow. Topaz and Bridgeport reservoirs are near capacity at 58,000 and 41,000 acre-feet respectively. Walker River Basin snow pack is 63 percent of the March 1 average with little low-elevation snow remaining. Remote radio sensors indicate the melt started at high elevations about February 20.

The East Walker near Bridgeport is forecast to flow 40,000 acre-feet, or 70 percent of average (1948-62), while the West Walker near Coleville is expected to flow 110,000 acre-feet, or 78 percent of average.

Snow courses in the Tonopah SCD indicate only about 86 percent of average water content on February 28, although a 24-inch snowfall was recorded in the city of Tonopah in a two-day period during the month.

Snow measurements affecting Austin, Meadow Valley, and Esmeralda SCD's indicate much below-average water content this year. Streamflow in these areas is already underway and is expected to recede much earlier than usual, unless above-normal precipitation occurs this spring.

WATER SUPPLY OUTLOOK

WHITE PINE S.C.D., WHITE PINE, LINCOLN & NYE COUNTIES, NEVADA

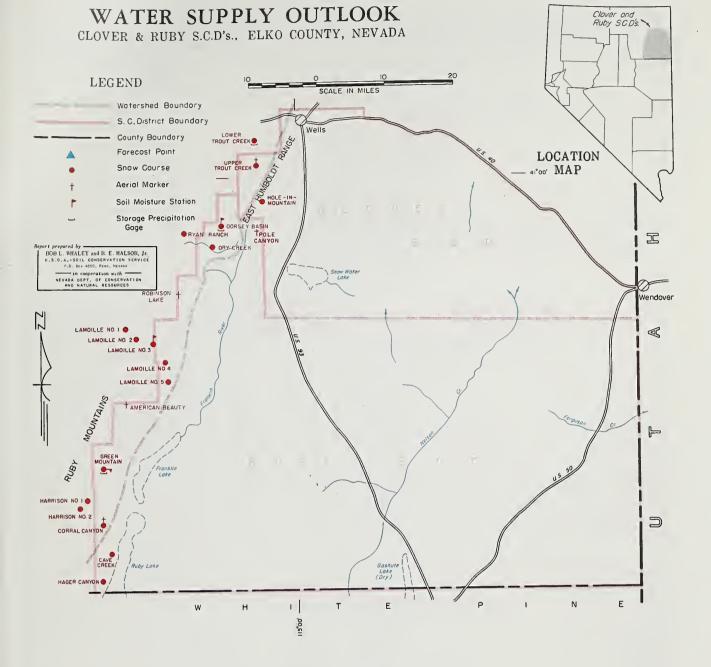

Early-season streamflow in White Pine County is expected to be fair, with poor late-season flows.

Snow cover, county-wide, is about 72 percent of the March 1 average. The Snake range, near Baker, has near-average snow water on the Baker Creek watershed. The Schell range, near McGill, has about 72 percent of average snow cover. Ward Mountain, Silver Creek, and Baker #3 snow courses were observed by airplane this year, with the water content being estimated. These water contents should not be compared to the average of the whole snow course as measured in past years.

Lower-elevation snow courses at Murray Summit, Robinson Summit, and White River showed only a trace of snow or were completely bare.

March 1, 1968

The 1968 water supply outlook for Clover and Ruby SCD's is well below average.

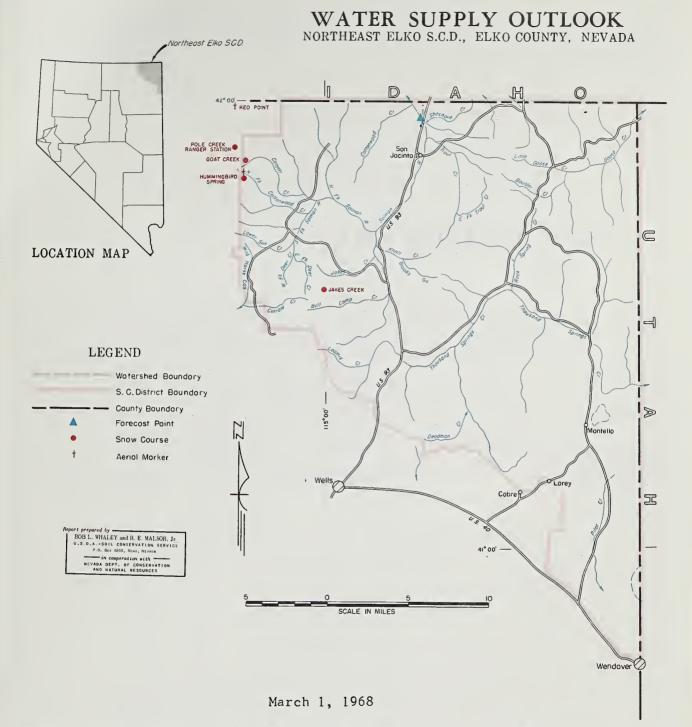

Snow cover along the Rubys did not increase significantly during February, and it is now only 50 percent of the March 1 average. Low-elevation snow was washed off by rain or melted by warmer-than-average temperatures.

Watershed soils are well primed and should aid runoff and forage production.

Streams are expected to have fair early flows, but they will recede earlier than usual unless above-average precipitation occurs during the remainder of the spring and summer again this year.

The 1968 water supply outlook for Northeast Elko SCD is only fair.

Snow measurements taken on February 26 show 75 percent of average snow cover and about 27 percent less than last year at this time. Streamflow forecasts for Salmon Falls Creek are only 68 percent of average. Forecasts indicate 53,000 acre-feet is expected during March-September and 52,000 acre-feet March-July.

Small streams of the area can be expected to flow early and will dry up earlier than usual, unless above-average precipitation occurs during the runoff season.

March 1, 1968

Duck Valley and Owyhee SCD's are expected to have "poor" irrigation water supplies this year.

Snow cover over the area is now only 37 percent of average, with lower elevations completely bare.

Above-average precipitation during February coupled with warm temperatures caused snow melt to about the 7,000-foot elevation. Watershed soils are now well primed in this area and should add to future runoff.

Streamflow forecasts on the Owyhee are 36 percent, or 8,000 acre-feet, at Gold Creek and 43 percent, or 32,000 acre-feet, at Owyhee. Smaller streams are expected to flow early and will recede earlier than usual unless above-average precipitation occurs during the runoff period.

WATER SUPPLY OUTLOOK

HUMBOLDT RIVER
CHURCHILL, ELKO, EUREKA, HUMBOLDT, LANDER & PERSHING COUNTIES, NEVADA

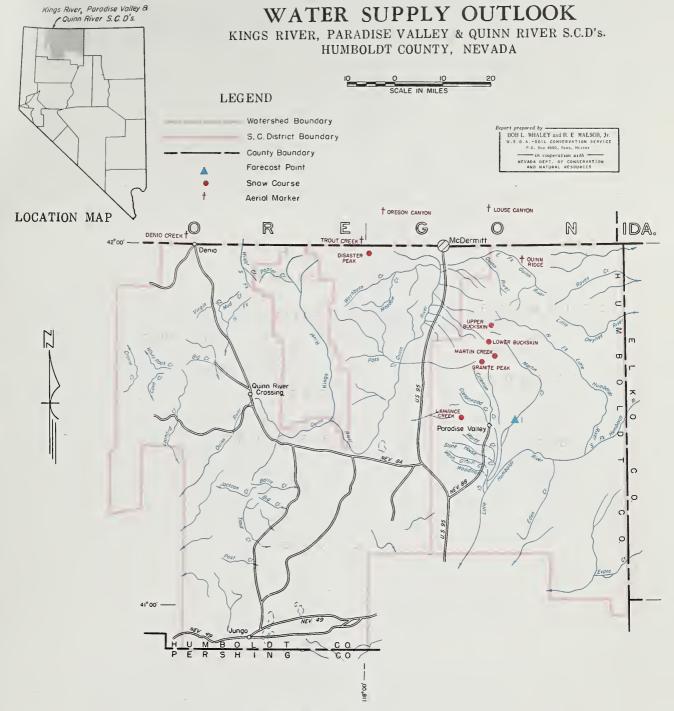

Humboldt River water supplies are expected to be "poor" this year for water users without storage. Rye Patch water users are expected to receive about half of their usual allotment, or 1.5 acre-feet, unless conditions improve during the next few weeks.

Snow cover in the Humboldt Basin is only 43 percent of the 15-year average (1948-62) and only about half as much as last year at this time. Precipitation was above average over most of the basin during February, but occurred as rain due to warm temperatures. Rye Patch Reservoir held about 60,000 acrefeet on March 1 compared to the average of 63,000. Streamflow during the month was only 70 percent of average at Palisade, with watershed soils soaking up a good portion of the rain and snow melt runoff.

Streamflow forecasts range from 38 percent, or 13,000 acre-feet, for the North Fork of the Humboldt to 65 percent, or 17,000 acre-feet, for Lamoille Creek during the April-July period. The South Fork Humboldt is expected to flow 30,000 acre-feet or 50 percent of average, and Marys River 20,000 acre-feet or 59 percent of its April-July average. The Humboldt at Palisade is forecast to flow 75,000 acre-feet, or 43 percent of average, and Martin Creek near Paradise Valley is expected to flow 7,000 acre-feet, or 41 percent of average.

U. S. DEPÄRTMENT OF AGRICULTURE SOIL CONSERVATION SERVICE USBASES PORTLAND ORGE 1844 M-1798-

March 1, 1968

The 1968 water supply outlook for Paradise Valley and the McDermitt area is poor. Snow cover is only 49 percent of the March 1 average and only 36 percent of last year's cover at this time. Snow has melted off lower elevations completely, and Granite Peak is the only snow course at higher elevation which has a near-average snow water content.

Martin Creek is forecast to flow 7,000 acre-feet, or 41 percent of average for the April-July period. Streams in this area are expected to flow early and drop early to yield poor late-season water supplies, unless above-average precipitation occurs during the remainder of the spring and summer months.

WATER SUPPLY OUTLOOK

VYA & GERLACH S.C.D'S., NEVADA and SURPRISE VALLEY S.C.D., CALIFORNIA

The 1968 water supply outlook for Surprise Valley is only fair. Snow cover on Surprise Valley streams is only 44 percent of the March 1 average and 44 percent of last year at this time. Individual snow courses range from 26 percent of the March 1 average at 49 Mountain to 78 percent on Barber Creek.

Streamflow forecasts for the April-September period range from 69 percent of average, or 26,000 acre-feet, on Deep Creek to 79 percent, or 4,100 acre-feet on Eagle Creek. Bidwell Creek is expected to flow 9,200 acre-feet, or 75 percent of average. Mill Creek is forecast to flow 4,200 acre-feet, or 76 percent of average.

Cedarville precipitation was 1.95 inches during February compared to an average of 1.41 inches. The total for the October-February period is 6.50 inches compared to an average of 7.99 inches.
